Each year more than 230,000 women are diagnosed with breast cancer in the United States and approximately 180,000 undergo mastectomies. Nicholas Pashos, 28, a PhD candidate in the Tulane University interdisciplinary [bioinnovation program](#), is working on a project that he hopes will one day transform breast reconstruction surgery.

He invented an experimental graft that plastic surgeons may use to regenerate a nipple and areola for complete breast restoration after cancer treatment.

Pashos has won a \$50,000 grant from the National Science Foundation Innovation Corps and \$25,000 from the New Orleans BioInnovation Center to develop his research. His company, [BioAesthetics](#), will compete next month as a finalist in the [Tulane Business Model Competition](#).
